ANNOUNCEMENTS

Announcements

- Outstanding assignments will be returned electronically during exams.
- Graduate students:
 - to submit a paper-based A2, please drop it to my office.
- Participation marks will be posted on Blackboard grade book during exams.

Today

- Case Study in:
 - Groupware / Computer Supported Cooperative Work
- Course wrap-up

HCI Case Studies

GROUPWARE

This section based on “Collaborative Software” from: <http://www.usabilityfirst.com> and Chapter 20 of course text

CSCW

- Computer supported cooperative work
- Still used but scope is much broader... perhaps “groupware” is better?
 - Not always cooperative
 - Not always work
 - Devices that are not traditionally called ‘computers’
- Also related to CMC: computer-mediated communication

What is groupware?

- Examples of groupware include:
 - Google docs
 - Cacao.com
 - Video conferencing software
 - Email
 - Desktop sharing
 - Social networking applications
- Other examples?

Why Groupware?

- to facilitate communication: make it faster, clearer, and more persuasive
- to enable communication where it wouldn't otherwise be possible
- to enable telecommuting
- to cut down on travel costs
- to bring together multiple perspectives and expertise

Why Groupware?

- to form groups with common interests where it wouldn't be possible to gather a sufficient number of people face-to-face
- to save time and cost in coordinating group work
- to facilitate group problem-solving
- to enable new modes of communication, such as anonymous interchanges or structured interactions
- ...

Issues for cooperative working

- Social activity is **fluid and nuanced** which makes it technically difficult to construct systems.
- Members of organizations usually have **differing and multiple goals**, and conflicts and their resolutions may actually be an important part of cooperative working.
- **Exceptional situations** are a commonplace part of normal working. Job roles are often informal.
- People like to know who else is in shared workspaces. People use this **awareness** to guide their own work.

Issues for cooperative working

- People learn to cooperate by **observing and participating** in communication and information exchange.
- How CSCW is used is a result of **negotiation** within the groups themselves.
- CSCW relies on a **critical mass** of people if it is to be effective.
- **Co-evolution** is an important factor in CSCW. We learn to adapt to the configuration of a technical system and we adapt the system to suit our needs.
- **Incentives** are centrally important. People will not cooperate unless there is something in it for them.

Grudin's Eight challenges for CSCW

1. The disparity between who does the work and who gets the benefit
2. Critical mass - CSCW needs a critical mass of people to participate
3. Social, political and motivational factors - Work is not just a rational activity, but a socially constructed practice, with all the shifting, conflicting motivations and politicking that this implies.
4. Exception handling in workgroups - work is social, and is supported by informal procedures as well as formal ones.

Grudin's Eight challenges for CSCW

5. Designing for infrequently used features
6. The underestimated difficulty of evaluating groupware - Group applications are inevitably more difficult to evaluate.
7. The breakdown of intuitive decision-making
8. Managing acceptance: a new challenge for product developers

Kinds of groupware

- One way we can classify groupware is in terms of the **time/space matrix**

Kinds of groupware

Design Challenges for Groupware

- All the normal usability principles apply
- +
- Networking technology & synchronization
- Size of groups: 1,000,000 or 5 people?
- Pace of interaction – rate of conversation
 - System responsiveness becomes more important
- Simultaneous support for different user roles
- “Critical Mass” effect

Adoption: Interoperability

The 1990's Videophone

Adoption: Perceived Benefit

- Requires benefit for the group + benefit (or at least no extra work) for individual
- For example: Office Calendar
 - Benefit for group scheduling if everyone keeps it up to date
 - Personal benefit to not doing so because software is difficult to use, prefer paper calendar, ...
- Other examples: Google Wave
- Solutions:
 - Social pressure
 - Ensure (perception of) personal benefit

Abuse: The “Commons” Problem

- Taking inappropriate advantage of anonymity
- Sabotaging group work
- Violating privacy

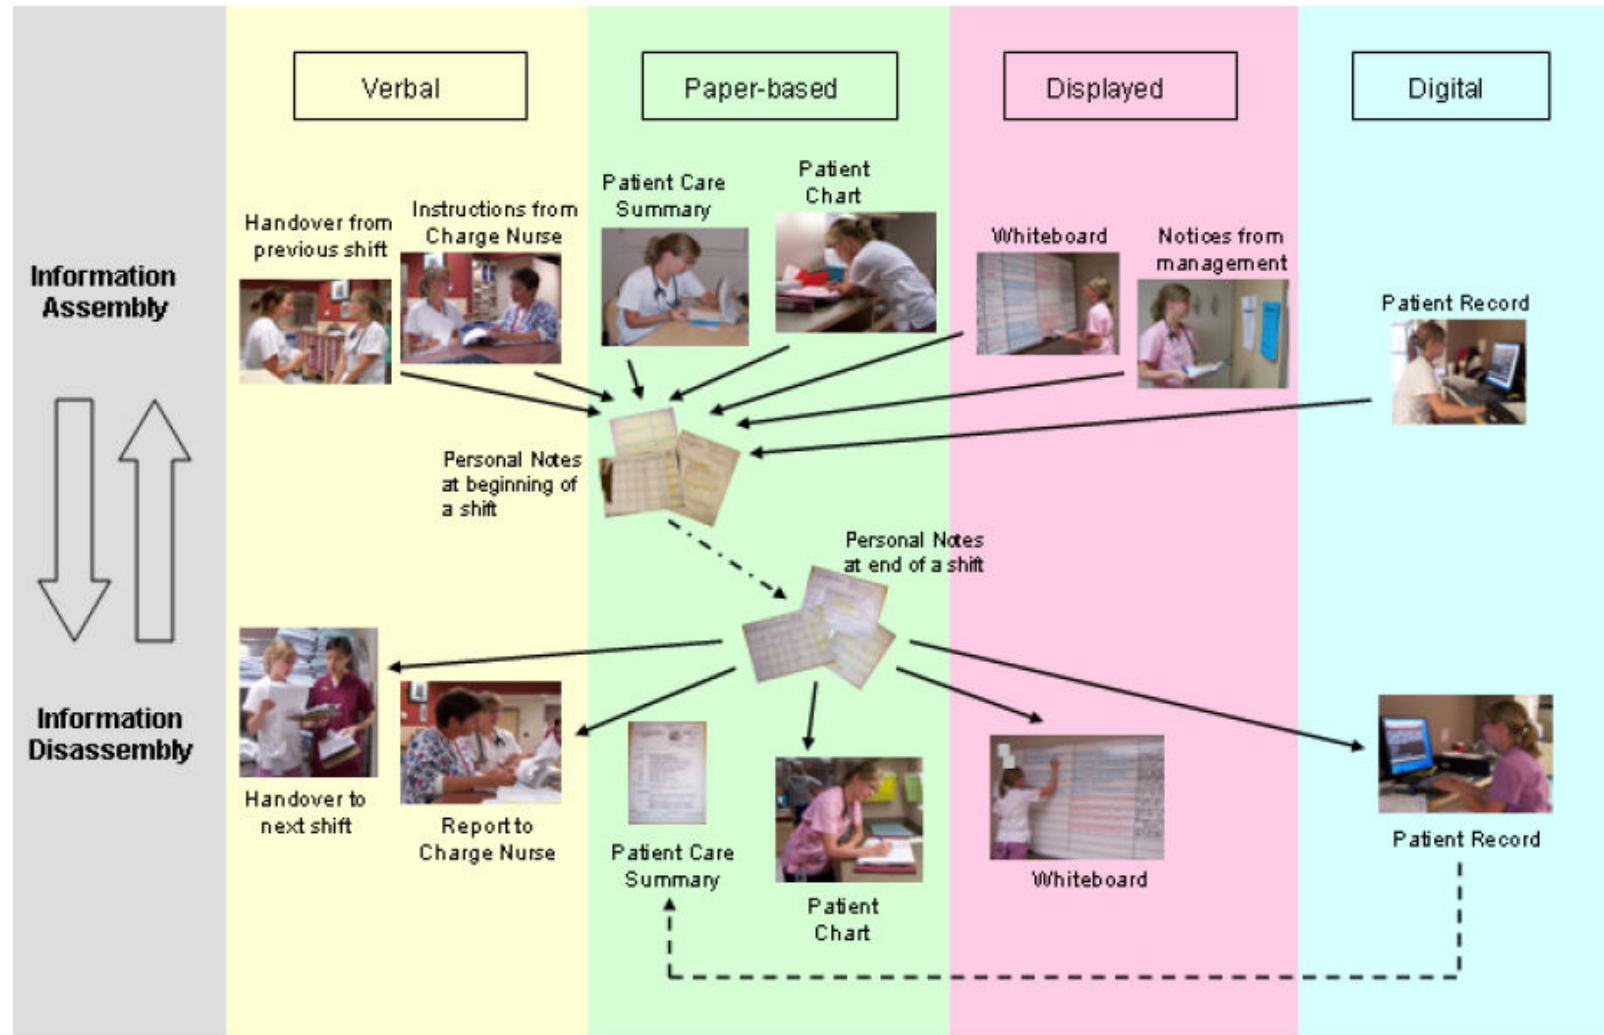

Social vs. Technological Structure

- Communication has structure
 - Technological structure: mediated by computer (fill out form, ask/response order)
 - Predictable and less error-prone; medical/military
 - Socially-mediated structure: free to be initiated and managed by human participants, e.g. email
 - Less obstructive, less dependent on designer correctly predicting patterns of use
 - More errors possible (no protocol)
- Facilitation vs. Enforcement

Customization and Grounding

- Different customizations (e.g. “warning” = red vs. “warning” = blue) can lead to miscommunication
- Different displays for different stakeholders:
 - Facilitate common understanding across expertise and tasks
 - But may introduce imbalances of understanding
- Awareness is important: provide cues as to what is common/shared and what is private

Example: Information Flow over Shift Change

Session Control

- Session control:
 - What spaces are available
 - Who can enter and exit the system
 - When
- Issues of:
 - Facilitation (including side conversations)
 - Privacy
 - Interruption management

Floor Control

- Access to shared artifacts (e.g. shared whiteboard)
 - Simultaneous (generally preferred)
 - Turn-taking
- Management of disruptive individuals
- Hybrid solutions:
 - Shared and private space
 - Recall – tabletop territories
 - Proximal interaction

NiCE Discussion Room

- <videos>

Privacy Options

- Privacy & Anonymity
 - Anonymity can be crucial to fair and open discussion
- Sharing, Identification, Accountability
 - More information leads to common ground
 - Useful for customization of interface
 - Accountability, reduction of abuse
- Control and Reciprocity
 - User-selected amount of control of privacy and anonymity
 - Requesting information requires sharing information

Evolution of Privacy on Facebook

Awareness

- Implicit communication is important
 - Gestures (“body language”)
 - Environmental factors (office door open/closed)
 - Common ground (background on participants)
- Balanced with privacy

Cambiera: Interaction Awareness

Collaborative Brushing and Linking

Where is Cambiera on
the space/time matrix?

Evaluating Groupware is Difficult

- Organizing and scheduling groups
- Group interaction style is difficult to select for when screening candidate participants
- Pre-established groups have different communication patterns
- New groups will change rapidly during the formation/solidification process
- Asynchronous groupware requires long term studies
- Modifying prototypes is more difficult due to software complexity
- New software and interface changes can be disruptive to an entire organization

Kinds of groupware

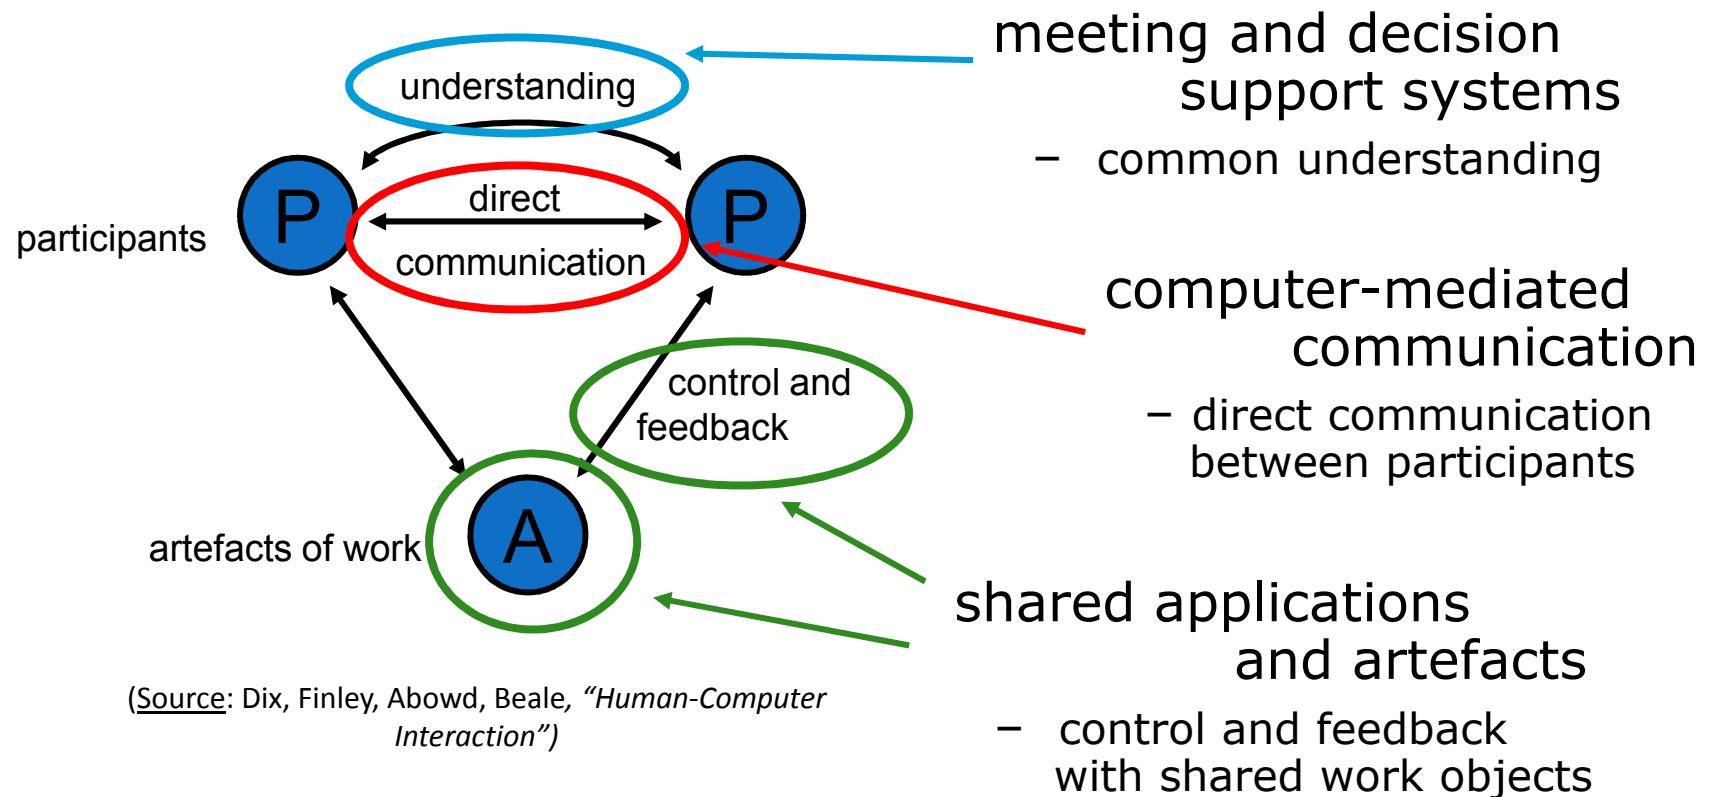

- Another way we can classify groupware is in terms of the **system function**
- Consider the **cooperative work framework**

(Source: Dix, Finley, Abowd, Beale, "Human-Computer Interaction")

Kinds of groupware

- Using the cooperative work framework we can classify systems by function:

Groupware in the Classroom

The screenshot displays the UOIT Groupware interface. At the top, the UOIT logo is on the left, and a user profile icon is on the right. Below the logo, the text "CHALLENGE INNOVATE CONNECT" is visible. A navigation bar contains links for "My Institution", "Notifications Dashboard", and "Organizations". A "My Institution" dropdown menu is also present. Below the navigation bar, there is a "Add Module" button. The main content area is divided into four sections:

- What's New:** Contains a "Edit Notification Settings" button, an "Actions" dropdown, and a timestamp "Last Updated: November 30, 2012 12:33 PM".
- My Announcements:** Displays a message: "No Institution Announcements have been posted in the last 7 days." Below this, it lists two announcements:
 - Computers and Media - 41255.201209-201209.41255-CSCI-1200U-001
 - > Reminders and tutorial cancelled
 - Human-Computer Interaction \ User Interfaces - CSCI4620U \ ENGR4850U - 201209 - 41291.201209.XLIST
 - > SmartTable available for final presentation
 - > Course Evaluation Fixed
 - > Final project parts postedA "more announcements..." link is at the bottom.
- My Calendar:** Displays a message: "No calendar events have been posted for the next 7 days." A "more calendar events..." link is at the bottom.
- My Courses:** Lists courses with expandable details:
 - 201201
 - Courses where you are: Instructor Designer
 - 201205
 - Courses where you are: Instructor Designer
 - 201209
 - Courses where you are: Instructor Designer
 - Computers and Media - 41255.201209-201209.
 - Announcements:
 - > Reminders and tutorial cancelled
 - Human-Computer Interaction \ User Interfaces 201209 - 41291.201209.XLIST
 - Announcements:

Models of Interaction

Heuristic Evaluation

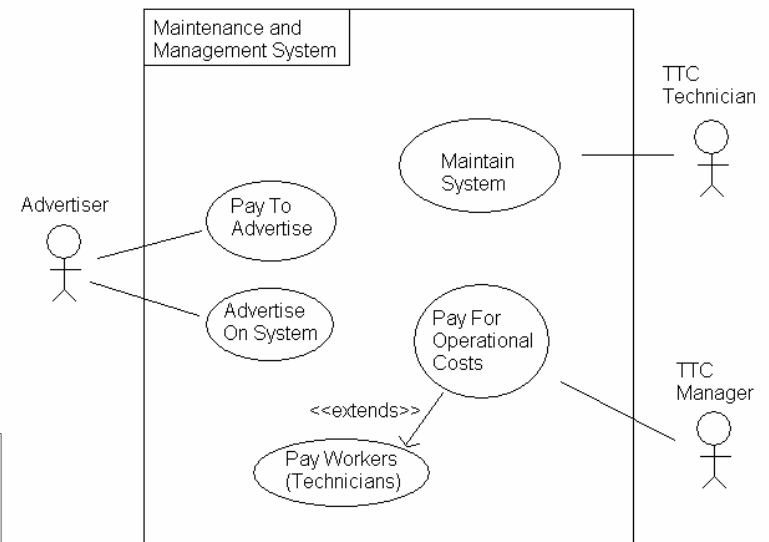

Tasks, Scenarios, Personas

Personas, on the other hand, reveal motivations and potential use cases. A consumer's motivation is what gets them interested in using a product. For example:

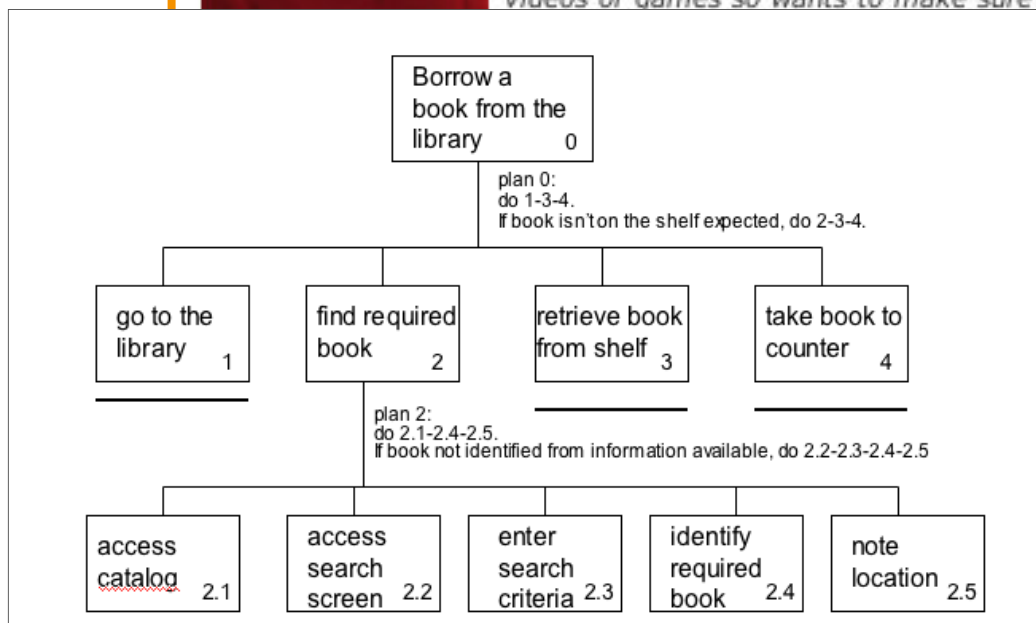

Kathleen is 33yrs old and lives in Seattle. She is a home mom with two children: Katie, 7, and Ben, 5. She drives the kids to school (usually carpooling with other kids) in her Volvo wagon. Kathleen bought the Sony rear-seat entertainment system last weekend at Best Buy to keep the kids entertained on the upcoming trip to see family in Canada.

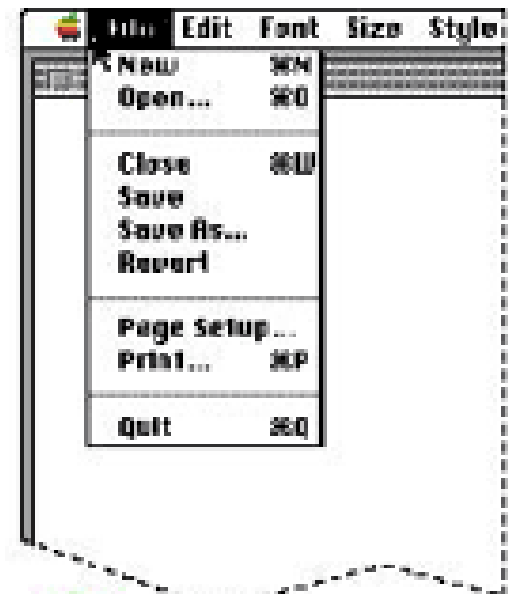

She doesn't want to be distracted by the videos or games so wants to make sure the system works properly.

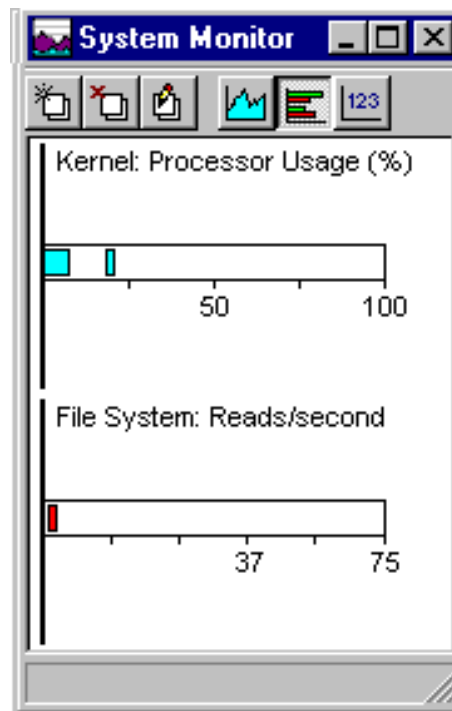

Advertiser does not necessarily
she likes to talk

Visual Design and Screen Layout

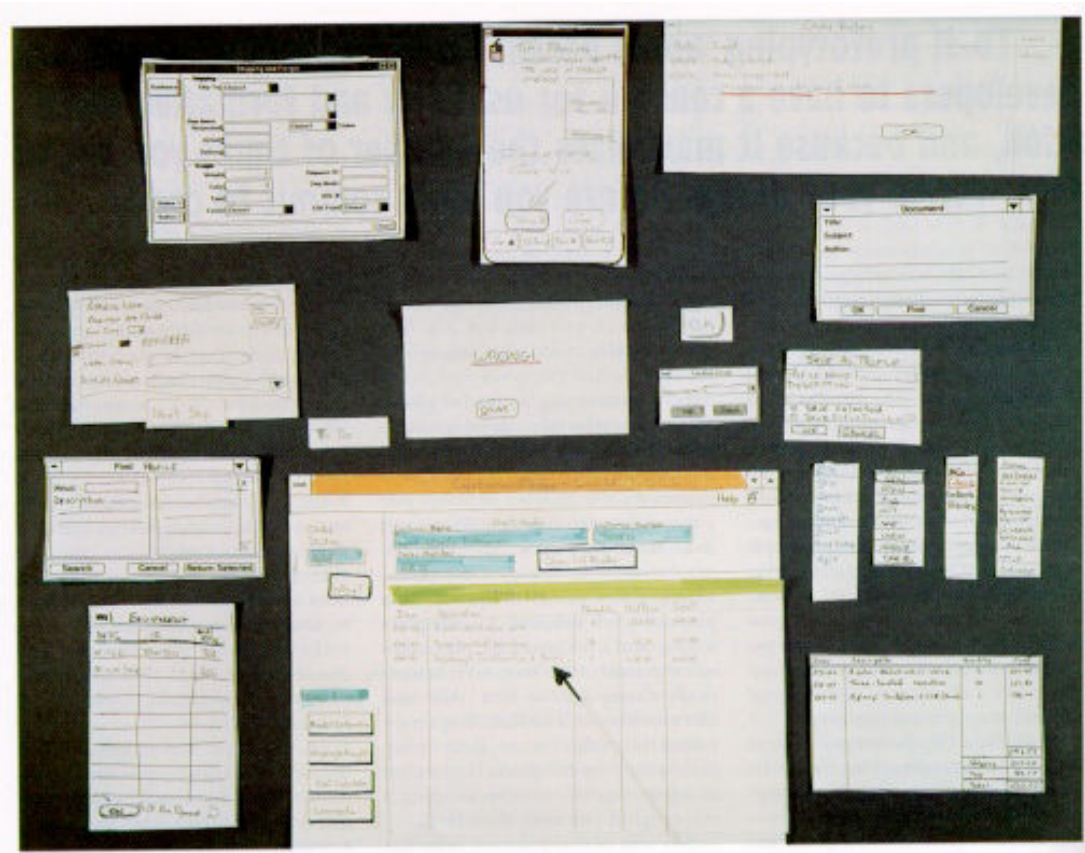

Representations to Support Tasks

Event Handling and Interface Software

Prototyping

Information Visualization Design

Universal Design

Evaluating Prototypes

- Learnability
- Flexibility
- Robustness

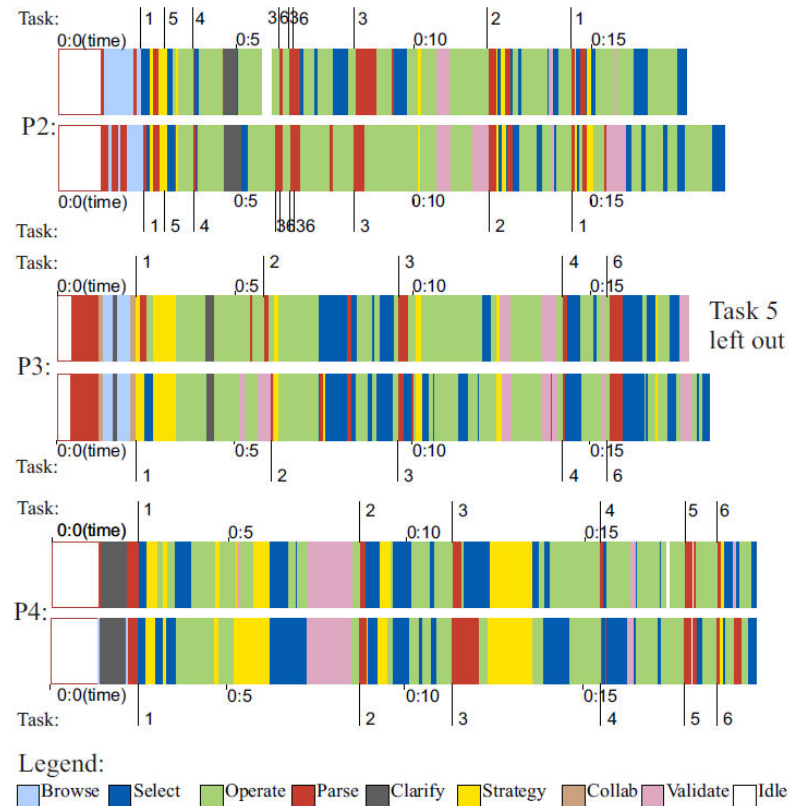

Figure 8. Temporal sequence of processes for three pairs during one complete scenario.

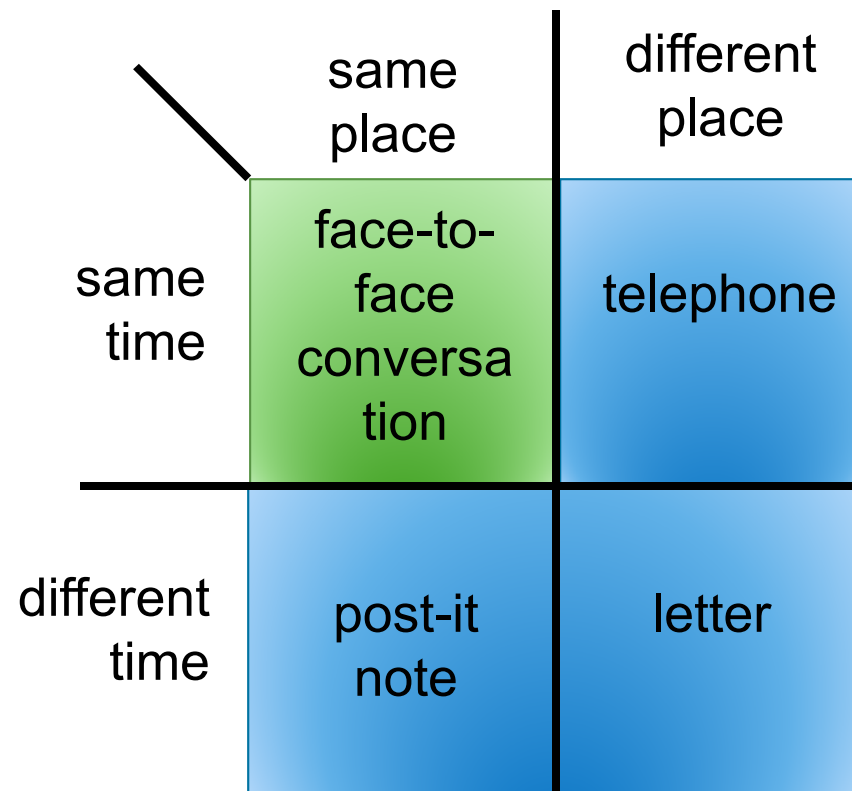

Usability Studies

- Roles
 - Test subject (“user”/ “participant”) (or two)
 - Facilitator
 - Computer (manage digital or paper prototype)
 - Observer(s)
- Running the study
 - Think aloud protocols
 - Cognitive walkthrough
 - Capturing and analyzing data

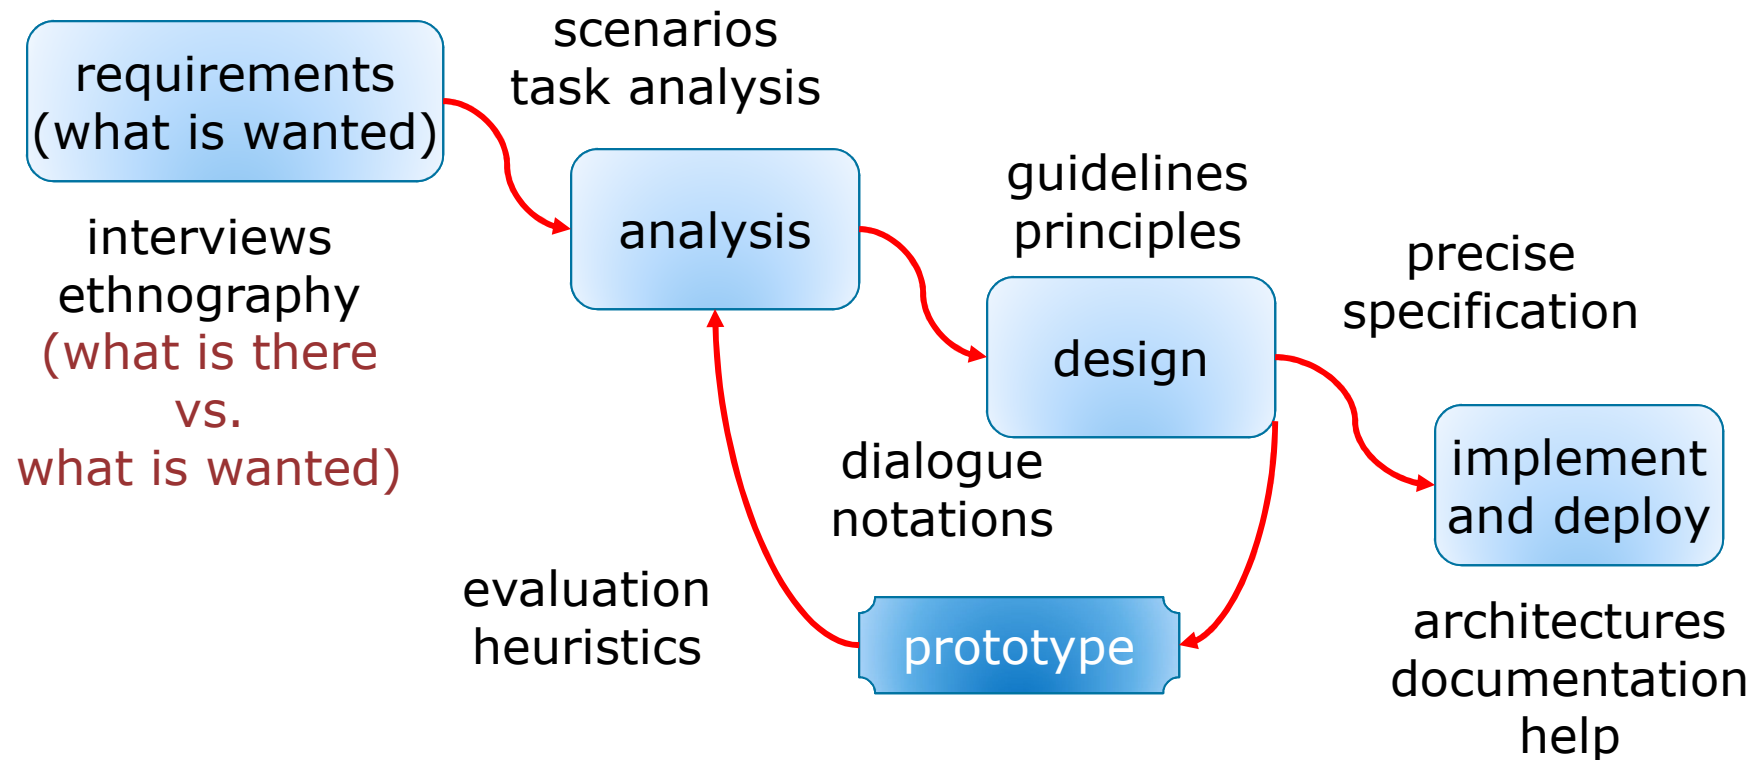

Ubiquitous Computing

Groupware

The Design Process

(Source: Dix, Finley, Abowd, Beale, "Human-Computer Interaction")

Final Step: Project Part 4b

- Design a usability study of your prototypes
- Report on your findings and changes you would make if you were continuing with the project

Summary

- Today we introduced:
 - Groupware
 - Course overview

Thanks for
a great term!

Ongoing Course Evaluation

- Please provide your feedback on today's lecture using the daily feedback form on Blackboard
